Presentation preparation	ATUL PATEL, SHREE NIKHILA

ABSTRACT

The Blood Management System (BMS) is an innovative healthcare project aimed at optimizing blood resource utilization and enhancing patient care through the integration of an Analytical Dashboard. Leveraging the MongoDB database and the MERN (MongoDB, Express.js, React, Node.js) stack technology, this system focuses on improving blood inventory management, donor engagement, and medical staff decision-making. Blood transfusions are critical medical interventions, often involving a complex process of blood collection, testing, storage, and distribution. Inefficiencies in this process can lead to shortages, wastage, and compromised patient care. The BMS aims to address these challenges by providing a comprehensive solution that combines data-driven insights with user-friendly interfaces. The system's foundation lies in MongoDB, a NoSQL database known for its scalability and flexibility. By employing MongoDB, the BMS can handle vast amounts of structured and unstructured blood-related data efficiently.

This includes donor information, blood type compatibility, storage conditions, expiration dates, and historical usage patterns. Such data can be complex and heterogeneous, making a relational database less suitable for the task. The MERN stack, composed of MongoDB, Express.js, React, and Node.js, is the cornerstone of the system's technology. Node.js powers the backend server, Express.js simplifies API development, React facilitates dynamic frontend interfaces, and MongoDB stores and retrieves data seamlessly. This stack ensures a smooth and responsive user experience while accommodating real-time updates, a necessity in healthcare settings.

One of the core features of the BMS is its Analytical Dashboard. The dashboard serves as a centralized platform that aggregates and visualizes key performance indicators, trends, and insights related to blood management. Authorized personnel, including medical professionals and administrators, can access this dashboard to monitor blood inventory levels, track donor engagement campaigns, predict demand, and identify usage patterns. These data-driven insights empower healthcare providers to make informed decisions, allocate resources effectively, and minimize wastage. The donor engagement module of the BMS enhances the blood supply chain by fostering a strong donor-donation relationship. Donors can register, schedule appointments, and receive notifications about blood drives or urgent needs. This two-way communication promotes regular donations, which in turn contributes to a stable blood supply. Additionally, the system can send personalized appreciation messages and updates to donors, fostering a sense of involvement and loyalty. Real-time alerts and notifications play a crucial role in the BMS. Healthcare facilities can receive automated alerts about critically low inventory levels, expiring blood units, or urgent requests. Such notifications enable rapid responses and prevent supply shortages during emergencies or unexpected spikes in demand. The implementation of the BMS involves multiple stages, including requirements analysis, system design, database schema development, backend and frontend coding, testing, and deployment. The Agile methodology is recommended for its iterative and collaborative approach, ensuring that the system meets evolving user needs and industry standards.

1. Introduction

A. Problem Statement:

The efficient management of blood resources within healthcare systems remains a critical challenge. Blood transfusions are an essential aspect of medical care, yet the processes surrounding blood collection, storage, distribution, and utilization often lack optimization. This can result in issues such as blood shortages, wastage, and compromised patient outcomes. Conventional approaches to blood management are often manual and lack data-driven insights, leading to inefficiencies and suboptimal decisions. The need for an innovative solution to address these challenges prompted the development of the Blood Management System (BMS).

B. Reason for Choosing the Project:

The decision to embark on the Blood Management System project stems from the pressing need for a comprehensive solution that leverages technology to enhance blood resource management. Traditional methods are labor-intensive and prone to human error, resulting in unpredictable blood availability and distribution. By utilizing MongoDB and the MERN stack, we aim to create an integrated system that offers real-time insights, seamless communication, and streamlined processes.

C. Objectives:

The Blood Management System project is designed to achieve several key objectives:

- 1. Optimized Blood Inventory Management:** The BMS aims to ensure that blood supplies are maintained at optimal levels across healthcare facilities. By analyzing historical data and usage patterns, the system can predict demand and supply, preventing shortages and excesses.
- 2. Enhanced Donor Engagement:** The project seeks to increase donor participation through streamlined registration processes, appointment scheduling, and personalized communication. By cultivating a strong donor-donation relationship, a stable and consistent blood supply can be maintained.
- 3. Real-time Data Insights:** The Analytical Dashboard component of the system provides healthcare professionals with real-time data insights. This empowers them to make informed decisions, track inventory levels, and respond swiftly to critical situations.
- 4. Efficient Blood Distribution:** The BMS aims to improve the distribution of blood products to hospitals and clinics. By identifying demand trends and efficiently allocating resources, the system minimizes the risk of shortages and wastage.
- 5. Emergency Preparedness:** Rapid response during emergencies is vital. The BMS can send automated alerts about critical inventory levels or urgent blood needs, enabling healthcare providers to take immediate action.

D. Challenges:

The development and implementation of the Blood Management System come with several challenges:

- 1. Data Complexity:** Blood management involves a variety of complex and heterogeneous data, including donor information, blood types, storage conditions, and usage history. Handling and structuring this data for efficient analysis is a significant challenge.
- 2. User Adoption:** Convincing healthcare facilities to adopt a new technology can be challenging. Overcoming resistance to change and ensuring the system aligns with existing workflows is essential.
- 3. Real-time Updates:** Ensuring that the system provides real-time updates while maintaining data accuracy and consistency is a technical challenge. Achieving this without compromising performance is crucial for the success of the system.
- 4. Security and Privacy:** Healthcare data is sensitive and must be protected. Ensuring the security of patient information, donor details, and medical records is a priority.
- 5. Integration with Existing Systems:** Integrating the BMS with existing hospital management systems, laboratory information systems, and electronic health records requires careful planning and coordination.
- 6. Scalability:** As the system gains users and data volume increases, ensuring that the system remains scalable and can handle growing demands is vital.

2. Literature Survey: -

Title	Author/ Journal Name/ Year	Technique	Result
Blood Donation Management with Modern Engineering	<p>Tanisha Madan Assistant Professor Computer Science and Engineering, BPIT, Rohini, New Delhi, INDIA</p> <p>Narender Bhardwaj Computer Science and Engineering, Scholar of BPIT Rohini, New Delhi, INDIA</p> <p>Shivam Kumar Mishra Computer Science and Engineering, Scholar of BPIT, Rohini, New Delhi, INDIA</p>	<p>This paper discusses a modern blood donation management system called Rudhiram built using technologies like React, Redux, Node, Express and MongoDB.</p>	<p>The goal of Rudhiram is to reduce the latency in the blood donation process by making it easier to manage and connect donors with patients who need blood.</p> <p>The key stakeholders of Rudhiram are:</p> <p>Donors who can register and search for nearby blood donation camps to schedule a visit.</p> <p>Patients who can search for compatible blood from hospitals and registered donors.</p> <p>Hospitals that can register and provide details of available blood types.</p> <p>Blood camps that can register to be listed for donors to find.</p> <p>Administrators who manage and verify all records.</p> <p>Rudhiram aims to simplify and automate the process of finding blood donors and maintain a centralized record of donors, recipients and blood stocks.</p> <p>The paper concludes that although Rudhiram provides a modern solution, there is still scope for improvement by adding features like live tracking, data analytics and SMS notifications.</p>
Blood Bank Management System		<p>Some key features of the proposed system are: admin access to</p>	<p>The paper proposes an automated blood</p>

		<p>registered user data, a notification alert system, and GPS tracking via registration. Cloud storage is also suggested for scalability. The system uses XAMPP and PHPMyAdmin for database hosting and management.</p>	<p>bank management system to reduce the efforts required to search for blood donors and manage their data. The current manual system is inefficient and leads to wastage of blood inventory. The proposed system would connect blood requesters and donors through a safe web-based platform with a simple registration process. The authors chose the Rational Unified Process methodology with four phases - Inception, Elaboration, Construction, and Transition. The study found that the system would reduce hassles of manual data entry and fears during emergencies. The authors believe the system will improve communication between donors, hospitals and blood banks. In summary, the proposed blood bank management system aims to provide a reliable platform for both blood donors and recipients through a faster and more efficient web-based</p>
--	--	---	--

			<p>application. This is expected to increase the chances of saving lives by making blood availability and accessibility better.</p>
<p>A Research Paper on Blood Donation Management System</p>		<p>The system uses the Django framework with modules for blood inventory management, donor management and administration. It can potentially be used during disasters to coordinate blood donors.</p>	<p>This paper proposes a blood donation management system to address issues related to the shortage of blood supply and inefficiency of the current system. The current blood bank system relies on physical records which makes information retrieval time-consuming and prone to errors. The authors developed a website that allows people to register as donors, hospitals to search for available donors, and maintains a centralized database of donor and health information. The system aims to provide timely supply of safe blood by collecting from voluntary unpaid donors. It allows donors to be notified of emergencies and hospitals to search for donors by location. The authors focus on security of data, tackling fake donors and requests, and updating donor health status regularly. In the future, the authors plan to explore data mining tools and develop a mobile app to connect with more donors. The system provides an effective web-based solution that can help save lives during emergencies by providing information on available blood</p>

			donors.
Centralized Blood Bank Database and Management System		The cloud database, PHP API, and Android app are used to build the system	<p>This paper proposes a centralized blood bank management system that aims to improve the efficiency of blood banks and make blood more accessible for patients, especially during emergencies in Nigeria. Currently, patients in Nigeria face difficulties accessing blood from blood banks due to manual and unorganized processes. The proposed system is an Android app connected to a secure cloud database that contains information on blood donors, patients, and blood banks. The system allows donors to easily register and locate nearby blood banks for screening and donation. Patients can search for matching blood donors near them and contact donors through the app. All blood banks on the system are government approved to ensure safe blood supply. The system aims to address challenges specific to Nigeria like logistical issues and poor network coverage. The app is designed to efficiently store, search, and sort large amounts of blood data in real-time.. The results show the app allows donors to book screening appointments, patients to search and request blood, and blood banks to manage donor information efficiently. The system has the potential to be scaled up with more features to improve its effectiveness.</p>

Research Paper on Blood Bank Donation and Management using Django	Shravani BS1, Raghavendra. R2	The application will be developed using Django for the frontend GUI and MySQL for the database	<p>This paper proposes a web application called Blood Warrior to help efficiently manage blood donations and connect blood donors with patients in need. There are currently manual blood bank systems that are inefficient, time consuming and prone to errors. The proposed application aims to address these issues by automating the process and connecting donors and patients online.</p> <p>The application will have three types of users - patients, donors and hospitals. Donors can register by providing their details and blood group. Patients can search for donors based on their required blood group. The application will provide contact details of matching donors so patients can reach out to them directly. Hospitals can act as an intermediary to manage communication. An experimental prototype is presented with donor registration, donor search functionality and a chatbot for user assistance. The study concludes that the online platform can help make blood available to those who need it. There is scope to improve the application further using machine learning and GPS technology. The proposed system aims to efficiently manage blood donations and save lives.</p>
Blood Bank Management System using Global Position	Mrs.A.Sunitha, M.E., Professor of Computer Science Department,	This paper proposes a new technique for managing blood banks using GPS	The proposed system aims to ensure the quality of blood and

<p>System</p>	<p>Ms.J.Jenifer Emima, Student of Computer Science Department,</p> <p>Ms.P.Pavithra, Student of Computer Science Department,</p> <p>Ms.D.Sarulatha, Student of Computer Science Department, St.Joseph College of Engineering, Sriperumbudur, Chennai</p> <p>Volume: 6, Issue: 3,Special Issue: 1 .Apr,2021 ,ISSN_NO: 2321-3337</p>	<p>and Android applications. Two Android applications are developed - one for blood requesters and another for blood donors. An intermediate server contains the database of previous blood donors. Blood requesters can send queries to the server for specific blood types using Google Cloud Messaging. The server then processes the query and notifies suitable blood donors. The blood donor's application will then send the GPS coordinates and contact number to the requester, only if the donor accepts the notification. This ensures the privacy of blood donors and their information is not shared without permission.</p>	<p>increase operational efficiency of blood banks. The fingerprint sensor is used to identify blood donors reliably. GPRS is also applied to transmit real-time data between the bloodmobile and blood center. RFID technology is used to manage the system conveniently. The web-based Android applications are scalable, efficient and adaptable to meet the complex needs of blood banks, which are key facilitators for the healthcare sector. In future, the system can be linked with other hospitals to share data. Statistical analysis and backup of databases can also be implemented.</p> <p>In summary, the proposed blood bank management system uses GPS and Android applications to identify and notify suitable blood donors. The system aims to provide blood in emergency situations reliably while ensuring donors' privacy.</p>
<p>Automated Blood Bank Using Embedded System</p>	<p>Abhijeet Moharkar 1, Akanksha Somani 2</p> <p>ISSN (Online): 2319-8753 ISSN (Print) : 2347-6710</p>	<p>The system consists of an Android application for patients, a Raspberry Pi computer for the blood bank administrator, and a cloud server for communication between patients and the blood bank. The Android application will allow patients to request blood groups and components based on their needs. The blood bank administrator will update the blood bag data in real time using the Raspberry Pi. The cloud server, which is a web page, is created using programming languages like HTML, PHP, CSS</p>	<p>The paper proposes an automated blood bank system using embedded systems to efficiently manage blood stocks and meet patient requirements.</p> <p>The aim of the system is to connect all blood banks on a common platform to better match blood requests with available stocks and provide transparency between patients and blood banks. This centralized system has the potential to improve the management of blood stocks and reduce wastage.</p>

		and JavaScript. It allows communication between the Android application and the Raspberry Pi. SMS is also used to notify patients about the status of their blood requests.	
Smart Blood Bank as a Service on Cloud	<p>Bharathwaj Muralidaran¹, Akshay Raut², Yogesh Salve³, Shivshankar Dange⁴, Likhesh Kolhe⁵</p> <p>IOSR Journal of Computer Engineering (IOSR-JCE) e-ISSN: 2278-0661, p-ISSN: 2278-8727, Volume 18, Issue 2, Ver. I (Mar-Apr. 2016), PP 121-124</p>	<p>Three main cloud service models: Infrastructure as a Service (IaaS), Platform as a Service (PaaS), and Software as a Service (SaaS). The technique used for development is the Rapid Application Development (RAD) model, emphasizing modularization, iterative development, and prototyping. Additionally, algorithms are presented for the registration and usage of the system by blood banks and donors.</p>	<p>The text discusses developing a web application hosted on the cloud to provide fast access to reports for blood banks. The cloud computing concept allows a multi-tenant environment for blood banks to store their data in the cloud database. A website is provided to users to see blood availability during emergencies.</p> <p>Currently, there are three main cloud service models: Infrastructure as a Service, Platform as a Service, and Software as a Service. The proposed system aims to improve the conventional blood bank management system using cloud computing. It will provide a website framework for blood banks to register and get their own account and data storage space.</p> <p>The data entered by blood banks will be stored in the cloud database. A customer website will then be created using this data to inform customers about blood availability. Each customer will have a unique login to access the website. This proposed system is more efficient, elastic, multi-tenant, secure, and user-friendly compared to traditional software. The Rapid Application Development model is used which focuses on modularization, iterative development, and prototyping. Algorithms are also presented for blood banks and donors to</p>

			register and use the system. In conclusion, the new system plays a vital role in blood bank management and service quality.
CLOUD BASED ONLINE BLOOD BANK MANAGEMENT SYSTEM	<p>1Aditya S. Iyer, 2Dr. C Menaka, 3Adnan Faisal , 4Ammar Hussain , 5Chethan</p> <p>S.D JETIR.ORG (ISSN-2349-5162)</p>	<p>Use of cloud computing for the development of the online blood bank management system. Specifically, it highlights the use of cloud computing to enable accessibility from anywhere at any time. The text also touches upon the challenges associated with cloud-based systems, such as ensuring data security, privacy, and system reliability.</p>	<p>The text discusses the concept of a cloud-based online blood bank management system. Such a system can help ensure the safe collection and storage of blood and make it easily accessible when needed, especially in emergency situations. The key benefits of such a system are:</p> <ul style="list-style-type: none"> • Improved availability of blood by connecting multiple blood banks and hospitals online. • Donors can access blood from any blood bank, not just where they donated. • Faster access to donor and blood bag information through a centralized online system. This can help save lives in emergencies. • Better record keeping of donors and their blood donation activities. • Quick identification of suitable blood bags for patients who need them urgently. <p>The proposed system would allow hospitals, donors and recipients to</p>

			<p>register and login. Hospitals can add details of available blood groups to the system. Recipients can search and request for specific blood groups. An admin manages the entire database and system security. Cloud computing enables such a system to be accessible from anywhere at any time. However, some challenges include ensuring data security, privacy and reliability of the system. Overall, an online blood bank management system has the potential to improve the safety and efficiency of blood transfusion services.</p>
<p>ON-LINE BLOOD BANK MANAGEMENT SYSTEM USING ANDROID</p>	<p>1Sunita Bhujbal, #2Kajal Jadhav, #3Snehal Kalokhe, #4Varsha Pingale</p> <p>International Engineering Research Journal (IERJ), Volume 2 Issue 10 Page 4228-4231, 2017 ISSN 2395-1621</p>	<p>The system architecture would involve tools like Android, Java, and a database to store donor information. An algorithm would be used to find eligible donors based on blood group and location.</p>	<p>The text discusses the concept of an online blood bank management system using Android. Such a system aims to make the process of obtaining blood from a blood bank more efficient and effective. The key features of the proposed system include finding blood donors nearby using GPS, sending alerts to registered donors, and enabling direct contact between donors and recipients. The goals are to reduce the scarcity of rare blood groups, make the process faster, and increase awareness about blood donation. The text mentions several advantages of such a system like helping people find donors quickly in emergencies. Some existing systems are also briefly discussed. In summary, an online blood bank management system that enables direct contact between donors and recipients has the potential to improve the current process of obtaining blood, especially during urgent situations.</p>

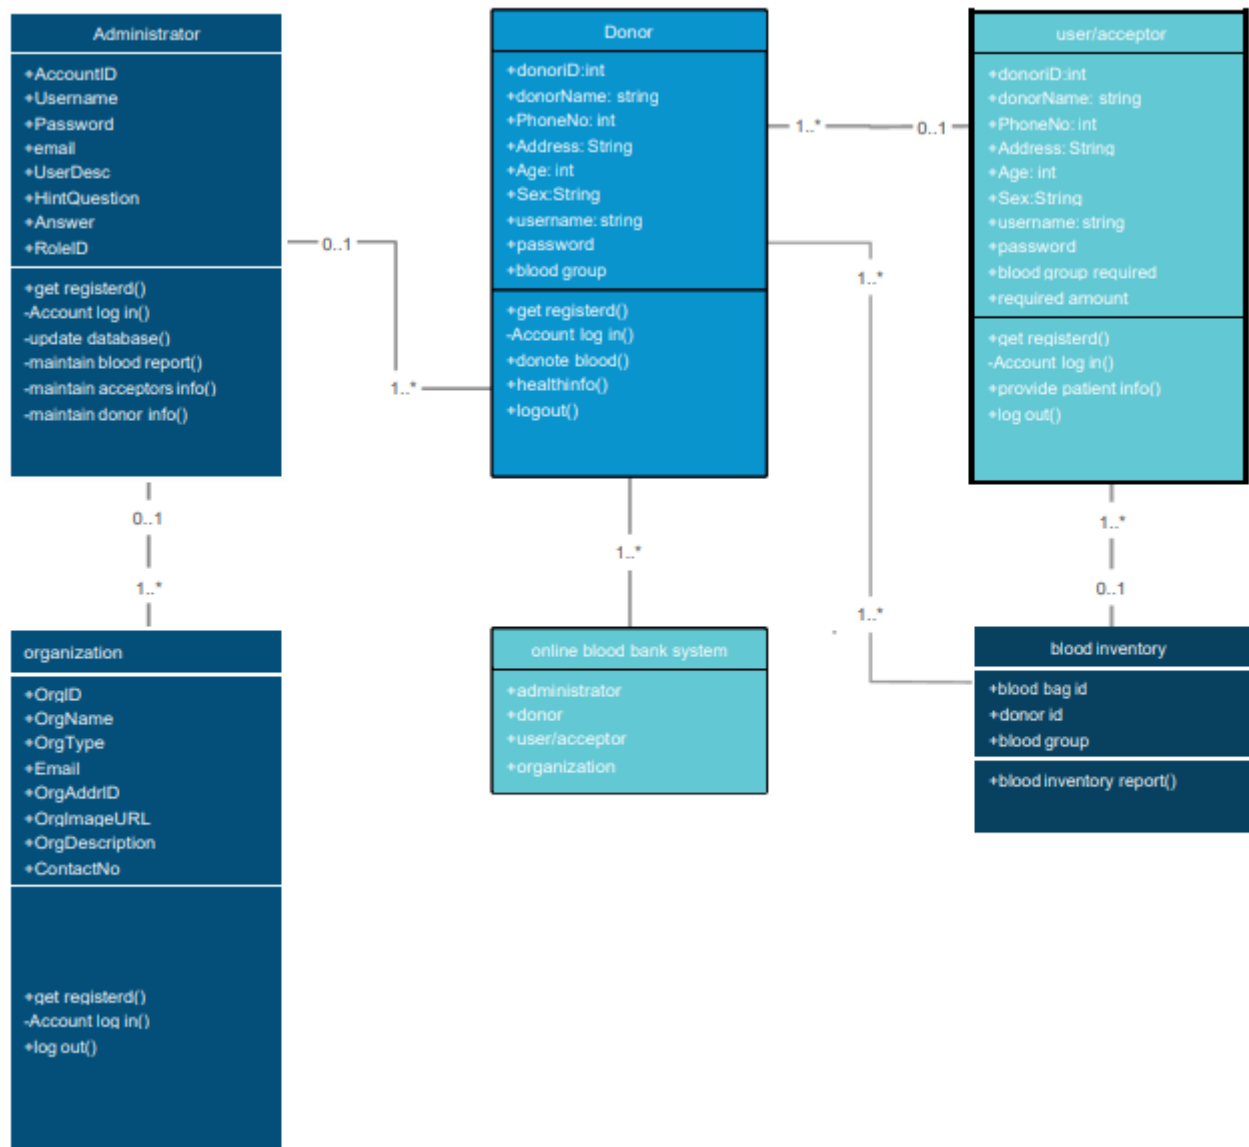

3. Dataset and Database specific Tool to be used

- Dataset of government health centre
- Blood donation centre of regional area

fig.show()
```

Top Districts with the Highest Number of Blood Banks in Andhra Pradesh

Question 9: "What is the license information for a specific blood bank?"

```
In [28]: # Pymongo Query
blood_bank_name = "G.B. Pant Hospital Blood bank"
license_info = collection.find_one({"Blood Bank Name": blood_bank_name})

# Answer
if license_info:
    print("License Information:")
    print(f"License Number: {license_info.get('License #')}")
    print(f"Date License Obtained: {license_info.get('Date License Obtained')}")
    print(f"Date of Renewal: {license_info.get('Date of Renewal')}")
else:
    print(f"Blood bank '{blood_bank_name}' not found.")
```

License Information:
 License Number: DL1/CLAA/ANI
 Date License Obtained: 14.6.1996
 Date of Renewal: 01.01.2012

Question 10: "Which blood banks are categorized as 'Charity' and are located in 'Andaman And Nicobar Islands'?"

```
In [29]: # Pymongo Query
charity_blood_banks_in_islands = collection.find({"State": "Andaman And Nicobar Islands", "Category": "Charity"})

# Answer
print("Charity Blood Banks in Andaman And Nicobar Islands:")
```

```
for blood_bank in charity_blood_banks_in_islands:
    print(blood_bank['Blood Bank Name'])
```

Charity Blood Banks in Andaman And Nicobar Islands:
Pillar Health Centre Blood Bank

Question :Service Availability by Blood Bank Category

```
In [30]: # Pymongo Query
pipeline = [
    {"$group": {"_id": {"Category": "$Category", "Service Time": "$Service Time"}, "count": {"$sum": 1}}
    ],
    {"$sort": {"_id.Category": 1}}
]

In [ ]:
```

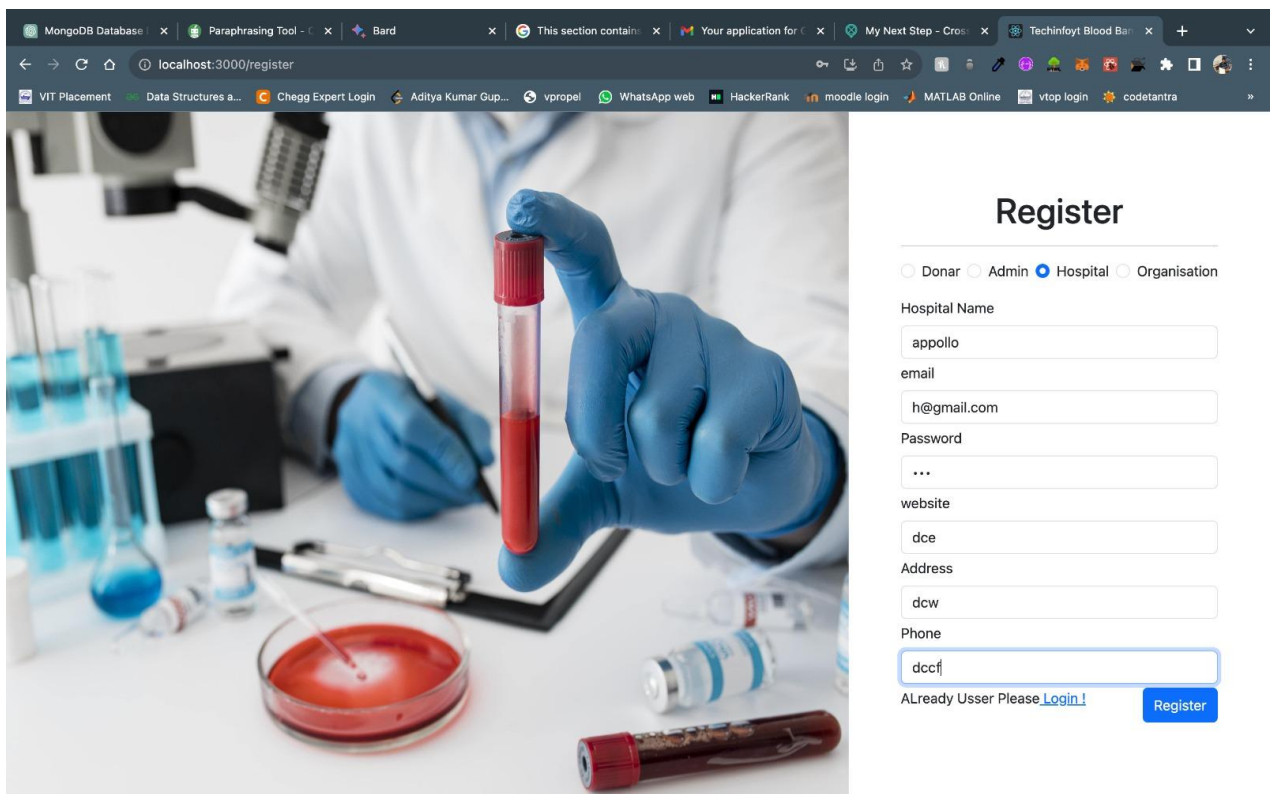

The Application can be accessed from four different user perspectives:

- **Donor/Receiver:** The donors and the ones in need can have their own login IDs to access the facilities of the system. A donor can add/remove an entry. They also can access the analytical dashboard tailored for them to get information they need.
- **Admin:** The administrator who has the control over the whole system. They can access all the information stored on the system. Admin has all the CRUD accessibility, i.e. it can Create, Read, Update and Delete any record that it wants to over the entire database. It also has access to an analytical dashboard which will show the visual representation of numbers.
- **Hospital:** Hospital can also be one of the points of access where they can have separate IDs and they can maintain their own stock of blood available. They can also raise a requirement of blood in case of need for it. Hospitals also have the accessibility to add or remove any of the records it wants to alongwith access to the analytical dashboard.
- **Organization:** Several NGOs and blood banks can also have their login IDs where they can maintain stock of blood available.

Development of The Project

Create: Users can add new entries using the CREATE functionality of the database. Here we can see that the user is using the CREATE operation to add a new entry for a blood sample.

Read: Users can use the READ functionality to fetch specific information from the database. In the scenario, we can see the data can be fetched using an analytical dashboard.

Update: Using the UPDATE functionality, users can update any of the record that needs to be modified.

The screenshot shows the 'Blood Bank App' with a 'Manage Blood Record' modal form open. The form has a 'Blood Type' dropdown set to 'AB-', a 'Donar Email' field with 'h@gmail.com', and a 'Quantity (ML)' field with '33'. There are 'Close' and 'Submit' buttons at the bottom. The background shows a sidebar with 'Organisation' and 'Consumer' options, and a table with 'Donar Email' and 'Time & Date' headers.

Delete: Any unwanted record can be removed from the database by using the DELETE functionality.
